

# Wave Spectra Notes

## 1 Overview

The goal is to consolidate some of the existing literature and notes about wave spectra as they pertain to generating simple, but physically realizable, wave fields for simulation.

## 2 General Properties and Relationships

### 2.1 Properties

Consider a zero-mean, wide-sense-stationary, continuous time random process  $x(t)$ . The expected instantaneous power  $E[x^2(t)]$  is equivalent to the variance in the signal  $\sigma_x^2$ , the autocorrelation function  $R_{xx}(\tau)$ , integral of the power spectral density (spectrum)

$$\sigma_x^2 = E[x^2(t)] = R_{xx}(\tau = 0) = \frac{1}{2\pi} \int_0^\infty S_{xx}(\omega) d\omega$$

The PSD is the Fourier transform of the autocorrelation

$$S_{xx}(\omega) = \mathcal{F}R_{xx}(\tau)$$

We can relate a spectrum expressed in angular frequency,  $S(\omega)$ , as a spectrum expressed in ordinary frequency,  $S'(f)$  as <sup>1</sup>

$$S'(f) = S(\omega = 2\pi f) \frac{d\omega}{df} = (2\pi)S(\omega = 2\pi f) \quad (1)$$

where the factor of  $2\pi$  insures that the area under the curve stays the same <sup>2</sup>.

## 3 Relating Spectra in Space and Time

Techet notes<sup>3</sup> the general form of a fully-developed wave spectra, as a function of temporal frequency,

$$S(\omega) = \frac{C}{\omega^5} \exp \left[ -D/\omega^4 \right]. \quad (2)$$

A wave spectra can be equivalently expressed as a function of three different variables:

1.  $\omega$ : *angular frequency* in rad/s,
2.  $f$ : *ordinary frequency* or just *frequency*,  $\omega = 2\pi f$ , in cycles/s or Hz, or
3.  $k$ : *wave number*,  $k = 2\pi/\lambda$ , in rad/m.

---

<sup>1</sup>We use the prime notation in  $S(\omega)$ ,  $S'(f)$ ,  $S''(k)$  to differentiate between expressions of equivalent spectra with different independent variables.

<sup>2</sup>[http://www.wikiwaves.org/Ocean-Wave\\_Spectra](http://www.wikiwaves.org/Ocean-Wave_Spectra)

<sup>3</sup>[https://ocw.mit.edu/courses/mechanical-engineering/2-22-design-principles-for-ocean-vehicles-13-401/readings/lec6\\_wavespectra.pdf](https://ocw.mit.edu/courses/mechanical-engineering/2-22-design-principles-for-ocean-vehicles-13-401/readings/lec6_wavespectra.pdf)

Next we need to specify the dispersion relation<sup>4</sup>. For deep water

$$\omega = \sqrt{gk} \quad (3)$$

$$c_p = \frac{\omega}{k} = \sqrt{\frac{g}{k}} \quad (4)$$

$$c_g = \frac{\partial \omega}{\partial k} = \frac{1}{2} \sqrt{\frac{g}{k}} \quad (5)$$

where  $c_p$  is the phase velocity and  $c_g$  is the group velocity.

The process of relating spectra expressed as functions of angular frequency ( $\omega$ ) or wavenumber ( $k$ ) is described in [1]. The constraint is that total wave height variance must be independent of independent variable (area under the curve doesn't change), which is expressed as

$$\int S''(k) k dk = \int S'(f) df. \quad (6)$$

If we follow the argument of equating the energy density in spectral bands [], then

$$S''(k) = S'(f) \frac{1}{k} \frac{df}{dk} \quad (7)$$

and since

$$f = \frac{\omega}{2\pi} \rightarrow \frac{df}{dk} = \frac{d\omega}{dk} \frac{1}{2\pi} \quad (8)$$

we can substitute the definition of the group velocity

$$c_g = \frac{\partial \omega}{\partial k} \quad (9)$$

so that in general

$$S''(k) = S'(f) \frac{c_g}{2\pi k} = S(\omega) \frac{c_g}{k} \quad (10)$$

and specifically for the deep water definition of  $c_g$

$$S''(k) = S' \left( f = \frac{\sqrt{gk}}{2\pi} \right) \frac{\sqrt{g}}{4\pi (k^{3/2})} = S \left( \omega = \sqrt{gk} \right) \frac{\sqrt{g}}{2 (k^{3/2})}. \quad (11)$$

If we apply this to (2) we can express the general form of a fully-developed spectrum in deep-water as

$$S(\omega) = \frac{C}{\omega^5} \exp \left[ -D/\omega^4 \right] \quad (12)$$

$$S''(k) = \frac{C}{2g^2 k^4} \exp \left[ -D/(gk)^2 \right] \quad (13)$$

## 4 Phillips Spectrum

The generic Phillips spectrum is reported by [2] as

$$S''_{Ph}(k) = \frac{A}{k^4} \exp \left[ -\frac{1}{(kL)^2} \right] = \frac{A}{k^4} \exp \left[ -\frac{g^2}{(k^2)(U^4)} \right]. \quad (14)$$

---

<sup>4</sup>[https://en.wikipedia.org/wiki/Dispersion\\_\(water\\_waves\)](https://en.wikipedia.org/wiki/Dispersion_(water_waves))

We can convert this to an expression in terms of angular frequency. Using (11) we find

$$S(\omega) = S'' \left( k = \frac{\omega^2}{g} \right) 2 \frac{\omega^3}{g^2} \quad (15)$$

which lead to

$$S_{Ph}(\omega) = \frac{A(2)(g^2)}{\omega^5} \exp \left[ -\frac{(g/U)^4}{\omega^4} \right] \quad (16)$$

which agrees with the general form given in (2). This is close to, but not exactly the same as the expression derived in [3] (see equation (7)).

## 5 Pierson-Moskowitz

The Pierson-Moskowitz spectrum can be expressed as<sup>5</sup>

$$S_{PM}(\omega) = \frac{\alpha g^2}{\omega^5} \exp \left[ -\beta \left( \frac{\omega_o}{\omega} \right)^4 \right] = \frac{\alpha g^2}{\omega^5} \exp \left[ -\beta \left( \frac{g}{U_{19.5}(\omega)} \right)^4 \right] \quad (17)$$

where  $\alpha = 8.1(10^{-3})$  and  $\beta = 0.74$ ,  $\omega_o = g/U_{19.5}$  and  $U_{19.5}$  is the wind speed at 19.5 m above the sea surface.

The peak of the spectrum, where  $dS/d\omega = 0$ , occurs at  $\omega_p = \omega_o/1.14$ , therefore we can express the spectrum in terms of the peak angular frequency as

$$S_{PM}(\omega) = \frac{\alpha g^2}{\omega^5} \exp \left[ -\beta \left( \frac{\omega_p(1.14)}{\omega} \right)^4 \right] = \frac{\alpha g^2}{\omega^5} \exp \left[ -\frac{5}{4} \left( \frac{\omega_p}{\omega} \right)^4 \right] \quad (18)$$

Furthermore the relationship between significant wave height ( $H_{1/3}$ ) and wind velocity is

$$H_{1/3} = 0.21 \frac{(U_{19.5})^2}{g} \quad (19)$$

which lead to

$$S_{PM}(\omega) = \frac{\alpha g^2}{\omega^5} \exp \left[ -\beta \left( \frac{(0.21(g))^2}{H_{1/3}^2} \right) \frac{1}{\omega^4} \right] \quad (20)$$

This agrees with the expression Techet provides the Pierson-Moskowitz spectrum

$$S_{PM}(\omega) = \frac{\alpha g^2}{\omega^5} \exp \left[ -\frac{(0.032)g^2}{(H_{1/3})^2} \frac{1}{\omega^4} \right]. \quad (21)$$

Applying (11) to express the spectrum in terms of wavenumber yields

$$S''_{PM}(k) = \frac{\alpha}{k^4} \exp \left[ -\beta(0.21^2) \frac{1}{(H_{1/3})^2} \frac{1}{k^2} \right]. \quad (22)$$

---

## 6 Relating Phillips and Pierson-Moskowitz Spectra

If we want to equate the Phillips spectrum (14) with the P-M spectrum (22), the relationship between the constants is

$$A = \alpha \quad (23)$$

$$\left(\frac{g^2}{U^4}\right) = \frac{\beta(0.21)^2}{(H_{1/3})^2} \quad (24)$$

which suggests

$$H_{1/3} = \frac{0.18(U)^2}{g} \quad (25)$$

which is consistent with (19). Therefore, if we wanted to use the Phillips spectrum as expressed in (14),

$$S''_{Ph}(k) = \frac{A}{k^4} \exp\left[-\frac{g^2}{(k^2)(U^4)}\right], \quad (26)$$

we would choose  $A = \alpha = 8.1(10^{-3})$  and  $U = 2.33\sqrt{H_{1/3}(g)}$  which would provide a Phillips spectrum that is equivalent to the PM spectrum (20) and (21).
